HTML 5 Tables and Forms

Tables for Tabular Data Display

Tables can be used to represet information in a two-dimensional format. Typical table applications include calendars, displaying product catelog, inventory data, price table, financial data, calenders, etc. A two-dimensional table include caption, heading cell, row datal, and borders if needed.

As shown in HTML5 4.9 Tabular Data, http://www.w3.org/TR/html5/tabular-data.html. The elements that defined in HTML 5 for creating tables can be found:

<u>Element</u>		<pre>Meaning The table element represents data with more than one dimension in the form of table. Attributes: BORDER, ALIGN, WIDTH, CELLSPACING, CELLPADDING, BGCOLOR, BACKGROUND</pre>
<caption></caption>		The caption element represents the title of the Table.
<colgroup></colgroup>		The colgroup element represents a group of one or more columns in the table.
		The tbody element represents a block of rows that consists of a body of data.
<col/>		The col (column) element represents one or more columns in the coloum group.
<thead></thead>		The thead element represents the block of rows that concists of the column lables (headers).
<tfoot></tfoot>		The tfoot element represents the blocj of rows that concists of the column summaries (footers)
		The tr element defines a row of ceslls in a table. Attributes: ALIGN (left, right, center), VALIGN (top, middle, bottom)
>		The td element represents a data cell in a tbale.
		The th element represents a header cell in a table. Attributes : COLSPAN, ROWSPAN, ALIGN, VALIGN, WIDTH, HEIGHT

Table Border Styles Examples: (Figure 4.8, pp. 157)

```
<style>
table { border: solid 1 pt black; }
</Style>
<style>
     table {border: solid 1 pt black;}
     td {border: solid 1 pt black;}
</style>
<style>
     table { border: solid 1 pt black; border-collapse: collapse;}
            { border: solid 1 pt black; padding: 10 pt;}
</style>
<style>
     table { border: solid 1 pt black; border-spacing: 10pt;}
     td { border: solid 1pt black;}
Examples of Boxed Tables – Styles (Figure 4.9, pp. 158)
<style>
table{
     font-size: 0.8 em;
     font-family: Aerial, Helvertica, sana-serif;
     border-collapse: collapse;
     border-top: 4 px solid #DCA806;
     border-bottom: 1 px solid white;
     text-align: left;}
caption{
     font-weight: bold;
     padding: 0.25em 0 0.25 em 0;
     text-align: left;
     text-transform: uppercase;
     border-top: 1px solid #DCA806;}
</style>
<style>
     tbody tr {
     background-color: #F1F1F1;
     border-bottom: 1px solid white;
     color: #6E6E6E;}
     tbody td {padding: 0.75em;}
</style>
```

```
<style>
table {
   font-family: "Lucida Sans", Verdana, Arial, sans-serif;
  font-size: 1em;
}
tbody {
   background-color: #F1F1F1;
td, th {
  padding: 0.5em;
thead, tfoot {
   background-color: #CACACA;
caption {
   font-size: 1.2em;
   font-weight: bold;
   background-color: #DCA806;
   padding: 0.5em;
tbody tr:nth-child(odd) {
   background-color: white;
   </style>
Hover Effect and Zebra Strips – Table Examples (Figure 4.10, pp. 159)
<style>
      tbody tr:hover{
            background-color: #9e9e9e;
            color: black;
</style>
<style>
      tbody tr:nth-child (odd) {
            background-color: white;}
</style>
```

HTML Forms

A <form> element in a HTML page contains such <input> elements control as Text box, Text Area, Check Box, Radio button, Multiple Selection, Submit Command Button, Reset button, etc., that allows a Web page to gather information from users and send them back to a Web server for further processing.

HTML 5 section 4.1, describes:

"A form is a component of a Web page that has form controls, such as text fields, buttons, checkboxes, range controls, or color pickers. A user can interact with such a form, providing data that can then be sent to the server for further processing (e.g. returning the results of a search or calculation). No client-side scripting is needed in many cases, though an API is available so that scripts can augment the user experience or use forms for purposes other than submitting data to a server.

Writing a form consists of several steps, which can be performed in any order: writing the user interface, implementing the server-side processing, and configuring the user interface to communicate with the server."

The HTML5 specifications for Forms can be found at http://www.w3.org/TR/html5/forms.html.

Form Element and Attributes

You will need to use the following syntax for creating a form. All controls must appear between two <form> and </form> tags. A general <form> syntax using name, action, and method attributes is as shown below:

<form *name*= thisName *action* = thisAction *method* =thisMethod> </form>

Where:

- The *name* attribute is the name or ID of form to use in the document.
- The *action* attribute is the name of application program, a CGI program, on the server with valid URL that will be called to process the information.

• The *method* attribute specifies how the controls' value will be transmitted to the server via HTTP protocol. There are two methods: POST (environment variable) and GET (no special characters; for example, 1 < ½; a>b; or b).

Global attributes defined in the HTML 5, 4.10 Forms (http://www.w3.org/TR/html5/forms.html), include

- accept-charset Character encoding to use for form submission
- action URL to use for form submission
- autocomplete Default settings for autofill feature for controls in the form
- enctype Form data set encoding type
- method HTTP method to use for submission of form submission.
- name Name of form to use in the document.forms API
- novalidate Bypass form control validation for form submission
- target Browsing context for form submission

```
Example (Figure 4.11, Sample HTML form)
<form method="get" action="process.php">
   <fieldset>
       <legend> Details </legend>
       >
       <label> Title: </label>
       <input type+ "text" name ="title"/>
       >
       <label> Country: </label>
       <select name="where">
         <option> Choose a Country </option>
         <option> Canada </option>
         <option> Finland </option>
         <option> United States </option>
       </select>
       <input type ="submit/">
    </fieldset>
 </form>
```

Input Element and Attributes

Ref: HTML 5, The Input Element, http://www.w3.org/TR/html5/forms.html#the-input-element

Begin Tag	End Tag	<u>Meaning</u>
<input/>		Define an input element such as TEXT field, radio button, check box, and pass word field for a form.
		Attributes: TYPE, NAME, VALUE, ALIGN, CHECKED, MAXLENGTH, SIZE, SRC, ONCLICK, ONDBCLICK, ONSELECT, ONCHANGE, ONFOCUS, OBBLUR

Input Types and Variables

Text Box for Input
<INPUT TYPE="text" NAME="lastname">

Submit and Reset Buttons <INPUT TYPE="SUBMIT"> <INPUT TYPE="RESET">

Text Control

The text control is a box that the users can enter a single line of text such as name, address, and so on.

<input type= text name= "TextName" value = "DisplayInBox"> < /FONT>

CheckBox Control

ChekBox control is similar to check box in Visual Basic, a little square with an option checkmark. It is used to present a list of options, which the users can select more than one. The control's value can be 0 or 1; for example, checked (1) or cleared (0).

<input type = checkbox name = "check1">FirstBox < /FONT>

RadioButton

Control RadioButton controls are used to present lists of options, similar to the CheckBox control, but it allows one of them can be selected.

<input type = radio name ="level">Beginner

<input type = radio name ="level" checked>Intermediate

<input type = radio name ="level">Advanced

Command Button

Control Comment button can perform only two actions in the browser (Submit and Reset) without Script (VBScript, JavaScript, or PerlScript). The Submit command is to submit the entered data on the controls to the server. The Reset command is to reset all control values on the Form to their original values.

```
<input type = submit value = "Send Data"> < /FONT >
<input type = reset value = "Reset Value"> < /FONT >
```

Text Area Tags and Attributes

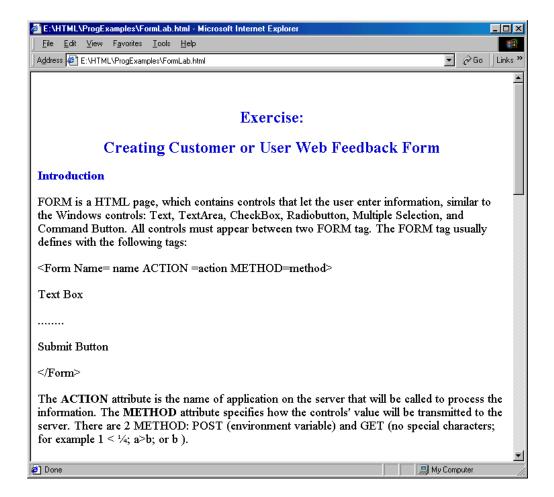

The TextArea control is similar to the Text control, but it allows the entry of multiple lines of text. The TextArea control can also defined with row and column.

	Begin Tag	End Tag	<u>Meaning</u>
<textarea></td><td><TEXTAREA></td><td></textarea>	Create a multi-line text entry area. Attributes: NAME, ROWS, COLS, WRAP, ONSELECT, ONCHANGE, ONFOCUS, ONBLUR, ONKEYDOWN, ONKEYPRESS, ONKEYUP		
			<textarea cols="yyy" name="" rows="xxx,"> </textarea>

Select and Option Tags and Attributes

Begin Tag	End Tag	<u>Meaning</u>
<select></select>		Create a combo box or a list box to let user select among many multiple predefined options. Attributes: NAME, SIZE, MULTIPLE, ONCLICK, ONFOCUS, ONBLUR, ONCHANGE
<option></option>		Attributes: VALUE, SELECTED

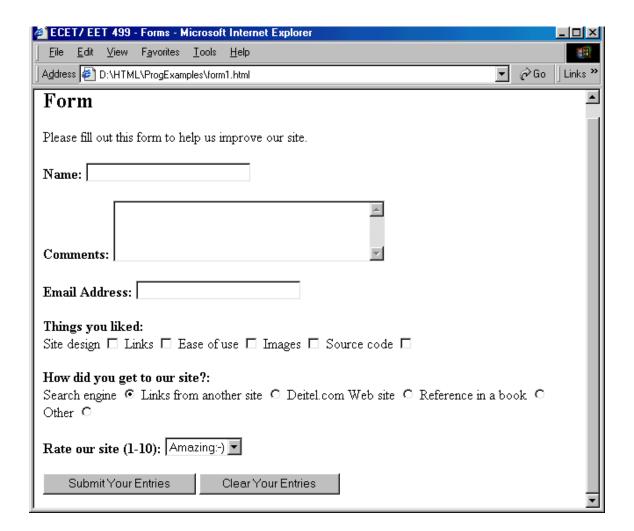

Example: The following example "FormLab.htm" will help you to understand the form basics. It

Example: A user feedback form example.

```

Query String, Get and Post Methods.

A browser will package the user's data input from Form/Input elements into something called Query String which is a series of *name=value* pairs separated by ampersands (& symbol) and send it back to the requested web server with either Get or Post method.

- Get method:
 - The browser locates the data in the URL of the request
 - It uses URL to send the query string, form data will be saved when the user bookmarks a page; including user name and password.
 - It may post a potential security risk for shared use computers
 - You will use it for testing or developing a web system
- Post method:
 - o The form data is located in the HTTP header after HTTP variables
 - ?? Paswwords

Run the user input form example as shown above, located as http://www.etcs.ipfw.edu/~lin/CECourses/2 HTML/05FormsEx/form1.html; then enter the following data into the form; finally click the Submit Your Entries button.

The browser will pack all the inputs and send it to a server CGI script called **formmail**. <FORM METHOD = " POST " ACTION = "/cgi-bin/formmail"> in the following format:

```
POST /cgi-bin/formmail http/1.1
Date: Mon, 19 September 2017 14:27 GMT
Host: ...
User-Agent: ...
Content-Length: xx

name=Paul Lin&comments=None&email=lin@ipfw.edu&thing=Design&how%20get%20to%20
site=search%20engine&rating=10
```

where %20 is character.
